

TIM SOUSTER

- 1. Rehearsal (7% i.p.s.) and performing (15 i.p.s.) copies of the tape may be obtained from Arts Lab Music, 11 Gosta Green, Birmingham B4 7ER.
- 2. The loudspeakers should be positioned on each side of the tuba player, at least 12 feet apart, so that as complete an accoustic field as possible between live and taped sound may be achieved.
- 3. The tuba-player's speaking voice may be lightly amplified, preferably through the same loudspeakers as used for the tape part. This will serve not only to clarify the text but also to heighten the 'radio announcer' tone of the tuba-player's delivery.
- 4. The opening water sounds on tape should start with the hall in complete darkness. Then a murky green light should fade up - bright enough for the tuba-player to read by - reaching full intensity just before the speech begins. If a gently undulating, "underwater" lighting effect can be devised, so much the better.
- 5. The player should calculate the point at which he/she should begin speaking from the time it takes him/her to read the opening text. The first recorded tuba note is roughly 1'25" after the opening water sound. The player needs to judge the speed of reading so that, after the end of the speech, a smooth transition can be made to the first live tuba note.
- 6. The tape part in the score gives only the two initial tape-delayed "repetitions" of the tuba line. Further canonic repetitions on tape are in fact heard in the bars' rests e.g., on pp. 8 and 16.

TIM SOUSTER

Commissioned by and dedicated to Melvyn Poore, who gave the work its, first performance.

0'00" (water sounds)

ppp — Pp

Normal speaking voice,

(moderate speed)

"On the bed of the Rhine: greenish twilight, lighter above, darker below. The heights are filled with surging waters, streaming ceaselessly from right to left. Towards the depths, the waters dissolve into an ever finer damp mist, so that the area at a man's height from the ground appears to be completely free of the water which flows by over the shadowy riverbed like drifting clouds. Steep reefs of rock jut out of the depths and mark out the edges of the stage area; the whole floor is split into a wild entanglement of jagged edges so that nowhere is it completely level. On all sides the presence of deep ravines can be sensed where the murk is at its densest. — The orchestra begins while the curtain is still down".

"Grently serene motion" (d.=ca60)
